

SevenShield

Quick guide — in simple steps

What does SevenShield do?

SevenShield protects folders and files on your computer with a password. Once you have locked something, no one can access the contents without this password, not even if the computer is lost or stolen.

1. Initial setup

Step 1: Install SevenShield

Run the installer and follow the on-screen instructions. After installation, SevenShield starts automatically.

Step 2: Activate the program

On first launch, SevenShield shows you a device code. Send this code to the seller by email using the button provided. You will then receive a license file in return, which you select in the program. After that, SevenShield is ready to use.

2. Protect a folder or file

Step 1: Add folder or file

Click "Add folder..." or "Add file..." and select what should be protected. You can also add several folders and files at once by dragging and dropping them onto the window.

Step 2: Set a password

Enter a password and repeat it in the second field. Remember this password well; without the password (and without the recovery key from step 4), no one can access the data anymore.

Step 3: Lock

Click the green button at the bottom (e.g. "Lock"). SevenShield encrypts the selected contents.

Step 4: Save the recovery key

After locking, SevenShield shows you a recovery key. This key helps you if you ever forget your password. Save it in a secure place, but NOT in the same folder as the protected data. The key will not be shown again afterwards.

⚠ Without the password AND without the recovery key, there is no way to recover locked data. Keep both stored separately and securely.

3. Unlock a folder or file again

Step 1: Select entry

Click on the folder or file in the list that you want to unlock. A  icon shows you that an entry is locked.

Step 2: Enter password

Enter the password that was originally used to lock the entry.

Step 3: Unlock

Click the button at the bottom (e.g. "Unlock"). The original data is then available to you normally again.

4. Working with several folders or files at once

You can select several entries in the list (by clicking with the Ctrl key held down) to lock or unlock only these together. If nothing is selected, SevenShield automatically processes all entries in the list.

- Important: a password only works for the entries that were also locked with this password.
- If you lock several entries at once, you will receive a combined overview with all new recovery keys at the end.

5. If you have forgotten the password

Use the recovery key that you received when locking and stored securely. In the program, choose the option to unlock using the recovery key, and enter the key instead of the password.

In short

- Add folder/file → set password → lock → save recovery key
- To unlock: select entry → enter password → unlock
- Forgot your password? → use the recovery key
